

This handout includes space for every question that requires a written response. Please feel free to use it to handwrite your solutions (legibly, please). If you choose to typeset your solutions, the `README.md` for this assignment includes instructions to regenerate this handout with your typeset L^AT_EX solutions.

2a To help you start the proof: Using the chain rule and the fact that $\sigma'(x) = \sigma(x)(1 - \sigma(x))$,

$$\frac{\partial L_G^{\text{minimax}}}{\partial \theta} = \mathbb{E}_{\mathbf{z} \sim \mathcal{N}(0, I)} \left[-\frac{\sigma'(h_\phi(G_\theta(\mathbf{z})))}{1 - \sigma(h_\phi(G_\theta(\mathbf{z})))} \frac{\partial}{\partial \theta} h_\phi(G_\theta(\mathbf{z})) \right] =$$

3a To help you get started with the proof: If we break the expectation up, we see that

$$\begin{aligned} L_D(\phi; \theta) &= -\mathbb{E}_{\mathbf{x} \sim p_{\text{data}}(\mathbf{x})}[\log D_\phi(\mathbf{x})] - \mathbb{E}_{\mathbf{x} \sim p_\theta(\mathbf{x})}[\log(1 - D_\phi(\mathbf{x}))] \\ &= -\int p_{\text{data}}(\mathbf{x}) \log D_\phi(\mathbf{x}) d\mathbf{x} - \int p_\theta(\mathbf{x}) \log(1 - D_\phi(\mathbf{x})) d\mathbf{x} \\ &= -\int (p_{\text{data}}(\mathbf{x}) \log D_\phi(\mathbf{x}) + p_\theta(\mathbf{x}) \log(1 - D_\phi(\mathbf{x}))) d\mathbf{x} \\ &= \int f(D_\phi(\mathbf{x})) d\mathbf{x} \end{aligned}$$

We can set $L'_D(\phi; \theta) = 0$ to obtain the optimal L'_D . This yields

$$L'_D(\phi; \theta) = \frac{d}{dD_\phi(\mathbf{x})} \int f(D_\phi(\mathbf{x})) d\mathbf{x} = \int \frac{d}{dD_\phi(\mathbf{x})} f(D_\phi(\mathbf{x})) d\mathbf{x} = 0$$

Now try to apply the hint!

3b To help you get started, note that

$$D_\phi(\mathbf{x}) = \sigma(h_\phi(\mathbf{x})) = \frac{1}{1 + e^{-h_\phi(\mathbf{x})}}$$

Setting this to the expression for $D^*(\mathbf{x})$ in part 3a solution, we find that

3c To get started

$$\begin{aligned} L_G(\theta; \phi) &= \mathbb{E}_{p_\theta(\mathbf{x})}[\log(1 - D_\phi(\mathbf{x}))] - \mathbb{E}_{p_\theta(\mathbf{x})}[\log D_\phi(\mathbf{x})] \\ &= \mathbb{E}_{p_\theta(\mathbf{x})} \left[\log \frac{1 - D_\phi(\mathbf{x})}{D_\phi(\mathbf{x})} \right] \end{aligned}$$

3d

4a To help you get started:

$$\begin{aligned} h_\phi(x, y) &= \log \frac{p_{\text{data}}(\mathbf{x}, y)}{p_\theta(\mathbf{x}, y)} \\ &= \log \frac{p_{\text{data}}(\mathbf{x} | y)}{p_\theta(\mathbf{x} | y)} + \log \frac{p_{\text{data}}(y)}{p_\theta(y)} \\ &= \log \frac{p_{\text{data}}(\mathbf{x} | y)}{p_\theta(\mathbf{x} | y)} = \end{aligned}$$

5a To help you get started:

$$\text{KL}(p_{\theta}(x) \parallel p_{\text{data}}(x)) = \mathbb{E}_{x \sim \mathcal{N}(\theta, \epsilon^2)} \left[\log \frac{\exp(-\frac{1}{2\epsilon^2}(x-\theta)^2)}{\exp(-\frac{1}{2\epsilon^2}(x-\theta_0)^2)} \right] =$$
